Ankara, Turquie
La Revue "Communications de la Faculté des Sciences de l'Université d'Ankara" est un organe de publication englobant toutes les disciplines scientifique représentées à la Faculté des Sciences de l'Université d'Ankara.

La Revue, jusqu'à 1975 à l'exception des tomes I, II, III était composé de trois séries:
- Série A: Mathématiques, Physique et Astronomie,
- Série B: Chimie,
- Série C: Sciences Naturelles.

A partir de 1975 la Revue comprend sept séries:
- Série A1: Mathématiques,
- Série A2: Physique,
- Série A3: Astronomie,
- Série B: Chimie,
- Série C1: Géologie,
- Série C2: Botanique,
- Série C3: Zoologie.

A partir de 1983 les séries de C2 Botanique et C3 Zoologie on été réunies sous la seule série Biologie C et les numéros de Tome commencerons par le numéro 1.

En principe, la Revue est réservée aux mémories originaux des membres de la Faculté des Sciences de l'Université d'Ankara. Elle accepte cependant, dans la mesure de la place disponible les communications des auteurs étrangers. Les langues Allemande, Anglaise et Française seront acceptées indifféremment. Tout article doit être accompagné d'un résumé.

Les articles soumis pour publications doivent être remis en trois exemplaires dactylographiés et ne pas dépasser 25 pages des Communications, les dessins et figures portes sur les feuilles séparées devant pouvoir être reproduits sans modifications.

Les auteurs reçoivent 25 extraits sans couverture.

Factors Governing The Stability
Of Some Metal-Thiol Complexes

E.M. KHAIRY, A.F. SHOUKRY* and J. AHMAD.

(Received October 4, 1983; accepted December 1, 1983)

It is quite important for exploring the nature of the chemical bonding and for predicting unknown stability constants to find relationships between the stability constants of the complexes and the characteristic properties of their constituents. The present work is devoted for investigating the relationships of the stability of Ni (II), Pd (II), Pd (IV), Pt (II) and Pt (IV) complexes with thiophenol and p-toluenethiol and the values of ionic radii, ionization potentials and electronegativities of the central ions. The stability of the coordinate compounds of the two similar ligands with the concerned metal ions are also compared.

The stability constants of Ni (II), Pd (II), Pd (IV), Pt (II) and Pt (IV) complexes with thiophenol (A) and p-toluenethiol (B) were determined in previous works¹. Some of the results are given in tables (1.&2).

Stability of Complexes and the Properties of the Central Ions.

The ionic radii, ionization potentials and electronegativities of nickel, palladium and platinum are shown in table (1) together with log B₁ and log B₂ values of their complexes with thiophenol (A) and p-toluenethiol (B). It is apparent that the stability constants are not inversely proportional to the ionic radii of these cations. Therefore it may be disclosed that the interaction between the above metal cations and thiols (A) and (B) is not purely electrostatic.
Table 1. Characteristic properties of nickel, palladium and platinum ions and log \( B_1 \) and log \( B_2 \) values of their complexes with thiophenol (A) and p-toluenethiol (B).

The ionisation potential can be regarded as a direct measure of the electron affinity of metal ion, which contributes to the stability of the metal complex. Although this comparison is only a rough approximation owing to the change in the electronic configuration during complex formation, fairly good relationships between ionisation potentials and stability constants have been reported. The values of log \( B_1 \) and log \( B_2 \) of Ni (II), Pd (II) and Pt (II) complexes with thiols (A) and (B) are plotted against the ionisation potentials of the metal ions (Fig. 1). It is obvious that the stability constants of the metal-thiol complexes increase linearly with the increase of ionisation potential.

In a series of increasing electronegativities of the metals, the electronegativity difference between a metal atom and the donor atom of the ligand would be expectedly decrease, associated with the increase of covalent character of the metal-ligand bond. This may eventually result into greater stability of the metal chelates. Relationships between the electronegativities of the metal ions and stability constants of the complexes have been established by many authors. In Fig. (2) are given plots of stability constants of Ni (II), Pd (II) and Pt (II) complexes with thiols (A) and (B) against the electronegativities of the metal ions. It is obvious that the stability constants of Pd (II) and also Pt (II) complexes are greater than the corresponding stability constants of Ni (II) complexes, which may be correlated with different electronegativities of the corresponding metal ions. This also suggests significant covalent nature of the metal-ligand bond in these complexes.
The complex-forming abilities of transition metal ions are frequently characterised by stability orders. The stability order established by Irving and Williams is valid for most nitrogen and oxygen donor ligands, irrespective of the nature of the ligand. According to the crystal field theory, the general validity of the Irving-Williams order is a consequence of crystal field stabilization. The above considerations are valid for high spin complexes only. It is already established that thiols frequently form low spin complexes with Ni (II). Fig. 3 comprises plots of $\log B_1$ and $\log B_2$ values of thiol complexes of Ni (II), Pd (II) and Pt (II), against the atomic numbers of the metals. It is seen from the plots that the straight line relationship is not valid.

**Comparison of Stability Constants of the Complexes of Two Similar Ligands With a Number of Metal Ions.**

Irving and Rossotti pointed out that the logarithms of the stability constants of complexes of a certain ligand with a number of metals...
plotted as function of log $B_n$ of the corresponding metal complexes formed with another but analogous ligand gives a straight line. From table (2), it is apparent that the stabilities of M-thiophenol (A) complexes are consistently greater than those of the M-p-toluenethiol (B) complexes. A plot of log $B_n$ of M-(A) complexes against the corresponding log $B_n$ values of M-(B) complexes is shown in Fig (4). A good linear relationship is obtained for log $B_1$ values but for log $B_2$ values this relationship holds roughly.
Fig. 3: Log $B_2$ of Ni (II), Pd (II) and Pt (II) complexes with thiophenol (A), and p-toluenethiol (B), as a function of atomic number (AN) of metals. (o log $B_1$ values • log $B_2$ values).
